EGDE INTELLIGENCE LAB ASSIGNMENT – 04

NAME: Rohit R

REG.NO: 25MML0003

# LOG DATA ANALYTICS:

## 1. Objective

Design and implement a system that performs **real-time log data analytics at the edge** to reduce latency, bandwidth usage, and dependency on centralized cloud systems. The goal is to enable faster anomaly detection, monitoring, and decision-making.

---

## 2. Background & Motivation

Traditional log analytics systems rely heavily on centralized cloud platforms, leading to:

- High latency in processing
- Increased network bandwidth usage
- Delayed anomaly detection

Edge computing addresses these challenges by **processing logs closer to the data source** (e.g., IoT devices, servers, microservices).

---

## 3. System Architecture Components:

1. **Log Sources** ○ Applications, microservices, IoT devices, servers
2. **Edge Layer (Core Focus)** ○ Lightweight log collectors (e.g., Fluent Bit) ○ Stream processing (filtering, aggregation) ○ Local anomaly detection using ML models
3. **Cloud Layer (Optional)** ○ Long-term storage ○ Batch analytics ○ Model training and updates

**Data Flow:**
Log Generation → Edge Processing → (Filtered Data) → Cloud Storage/Visualization

---

## 4. Key Features

- **Real-time log filtering and aggregation at edge**
- **Anomaly detection using lightweight ML models**
- **Bandwidth optimization (send only relevant logs)**
- **Low-latency alerting system**
- **Scalable across distributed edge nodes**

---

## 5. Technologies & Tools

- **Programming:** Python
- **Edge Processing:** Docker, Kubernetes (K3s for lightweight clusters)
- **Streaming:** Apache Kafka / MQTT

- **Log Collection:** Fluent Bit / Logstash
- **Analytics:** Apache Spark (edge or cloud), Pandas
- **Visualization:** Grafana, Kibana

---

## 6. Methodology

1. Collect logs from distributed sources
2. Preprocess logs at edge (cleaning, parsing)
3. Apply filtering rules (remove noise)
4. Perform real-time analytics (counts, error rates)
5. Run anomaly detection (threshold-based or RL/ML models)
6. Send summarized insights to cloud
7. Visualize results and trigger alerts

---

## 7. Use Cases

- Microservices monitoring
- IoT system health tracking
- Cybersecurity (intrusion detection)
- Server performance analysis

---

## 8. Evaluation Metrics

- Latency reduction
- Bandwidth savings
- Detection accuracy

- Resource utilization at edge

---

## 9. Expected Outcomes

- Faster insights with reduced delay
- Lower cloud dependency
- Efficient handling of high-volume logs
- Scalable and cost-effective analytics system

---

## 10. Future Enhancements

- Integration with reinforcement learning for adaptive log filtering
- Federated learning across edge nodes
- Advanced predictive analytics
