```

LEARNING OUTCOMES:

1. Video Processing Fundamentals: We learned how to extract frames from a video file using OpenCV, demonstrating basic video handling and frame manipulation (resizing, color conversion).
2. Image Classification with Pre-trained Models: We gained experience in applying a pre-trained deep learning model (MobileNetV2) from TensorFlow/Keras for image classification, including preprocessing images and interpreting model predictions.
3. Data Visualization for Analysis: We utilized Matplotlib to visualize extracted video frames, which is a fundamental skill for inspecting image-based data and verifying processing steps.
